WHEEL ALIGNMENT

1. MAKE FOLLOW CHECKS AND CORRECT ANY PROBLEMS
   (a) Check the tires for wear and proper inflation.
   Cold tire inflation pressure: See page A-14
   (b) Check the wheel runout.
   Lateral runout: 1.2 mm (0.047 in.) or less
   (c) Check the front wheel bearings for looseness.
   (d) Check the front suspension for looseness.
   (e) Check the steering linkage for looseness.
   (f) Check that the front absorbers work properly by using the standard bounce test.

2. MEASURE CHASSIS GROUND CLEARANCE
   Chassis ground clearance: See page A-14
   If the clearance of the vehicle is not standard, try to level the vehicle by rocking it down.
   If still not correct, check for bad springs or suspension parts.
   HINT: When measuring the front chassis ground clearance, measure from the ground to the center of the leading arm front mounting bolt.

3. INSTALL WHEEL ALIGNMENT EQUIPMENT
   Follow the specific instructions of the equipment manufacturer.

4. CHECK CAMBER AND STEERING AXIS INCLINATION
   Camber: $1^\circ \pm 45'$ ($1^\circ \pm 0.75^\circ$)
   Steering axis inclination: $13^\circ \pm 45'$ ($13^\circ \pm 0.75^\circ$)
   If the steering axis inclination is not as specified after camber have been correctly adjusted, recheck the steering knuckle and front wheel for bending or looseness.
5. **CHECK CASTER**

<th>Tire size</th>
<th>Caster</th>

<td></td>
</tr>
<tr>
<td>Other</td>
<td>3°00′ ± 60′ (3° ± 1°)</td>
</tr>
</tbody>
</table>

If caster is not as specified, inspect and replace damaged or worn parts.

6. **ADJUST WHEEL ANGLE**

Remove the caps of the knuckle stopper bolts and check the steering angles.

<table>
<thead>
<tr>
<th>Steering Type</th>

<tbody>
<tr>
<td>Max.</td>

<td>32° ±0° –3°</td>
</tr>
<tr>
<td></td>
<td>Outside Wheel 31°</td>
<td>29°</td>
</tr>
</tbody>
</table>

HINT: When the steering wheel is fully turned, make sure that the wheel is not touching the body or brake flexible hose.

If maximum steering angles differ from standard value, adjust the wheel angle with the knuckle stopper bolts.

**Torque: 450 kg-cm (33 ft-lb, 44 Nm)**

If the wheel angle still cannot be adjusted within limits, inspect and replace damaged or worn steering parts.

7. **ADJUST TOE-IN**

Adjust toe-in with a toe-in gauge in the following procedure.

(a) Rock the vehicle up and down to stabilize the suspension.

(b) Move the vehicle forward about 5 m (16.4 ft) with the front wheel in the straight-ahead position on the level place.

(c) Mark the center of each rear tread and measure the distance "B" between the marks of the right and left tires.
Advance the vehicle until the marks on the rear sides of the tires come to the measuring heights of the gauge on the front side.

HINT: If the tire rolls too far, repeat from step (b).

(e) Measure the distance "A" between the marks on the front of the tires.

(f) Measure the toe-in.

\[ \text{Toe-in} = B - A \]

Inspection standard: See page A-14
If toe-in is not specification, adjust by left and right tie rods.

(g) Loosen the clamp bolts and nuts.

(h) Adjust toe-in by turning the left and right tie rod tubes an equal amount.

Adjustment standard: See page A-14

(i) Torque the tie rod, clamp bolts.

\[ \text{Torque: 375 kg-cm (27 ft-lb, 37 Nm)} \]

HINT: Insure that the lengths of the tie rod ends are the same.

8. INSPECT SIDE SLIP (REFERENCE ONLY)

Side slip: 3.0 mm/m (0.118 in./3.3 ft) or less

DIFFERENTIAL LOCKING SYSTEM

Description

- The differential locking system slides the differential lock sleeve which is meshed to the axle shaft, and by meshing with the differential case, restricts the operation of the differential.
- In the vehicles, an electrical motor is used to slide the differential lock sleeve. Driving of the motor is accomplished by the ECU (Electronic Control Unit) in accordance with signals from the differential lock control switch on the instrument panel and from various other switches and sensors. This motor is built into the differential lock actuator.

Troubleshooting

NOTICE:
- Check that 4WD mode (Part-Time Models) or center differential lock mode (Full-Time Models) is set.
- When switching differential Free ↔ Lock, the indicator lamp will blink if the gears of the differential lock sleeve are not meshed. If this occurs, when the tires are rotated to apply differential power to the differential, the differential locks and the indicator lamp light up.

System Inspection

1. **INSPECT INDICATOR LIGHTS**

HINT: Put the shift lever on neutral.

(a) Jack up the vehicle then start the engine.

(b) Put on the 4WD switch (Part-Time Models) or the center differential lock (Full-Time Models).

(c) When the diff. lock control switch is set to RR position, the indicator light (rear side) is turned on. Differential lock is applied to the rear wheel at this time.

HINT: If the gears of the differential lock system are not meshed, the indicator light remains blinking, so rotate the tires to mesh the gears.

(d) When the diff. lock control switch is at OFF position, the indicator light goes off. Differential lock is released for the rear wheel at this time.

(e) When the diff. lock control switch is set to FR-RR position, the indicator lights (front side and rear side) are turned on. Differential lock is applied to both the front wheels and rear wheels at this time.

(f) Check the voltage between the terminals of the 4WD control ECU when switching the diff. lock control switch with the speedometer, registering approx. 8 km/h (5 mph) or more.
